

RFID CHIP

From the very first beginning, already 15 years ago, we supply almost all our ECS Pallets with an internal RFID Chip. The RFID chip is located inside the pallet runner.

Only customers, who explicitly rejected it, are using pallets without the RFID chips.

To serve customers who work with pallets without these internal RFID chip and the customers who bought pallets with RFID chip that show a defect, we introduce an Durable External Solution.

The ECS RFID chip

- The specs of the External RFID chip are identical to the Internal RFID chips.

Available?

- For customers who ordered EggsCargoSystem, we can add the RFID chips to their supply.
- In all other cases, we send the required number of ECS RFID chips by courier.

How?

- Manually. The chips are available separately.

For whom?

- ECS customers who bought EC Pallets including the RFID chip. In the unlikely situation it shows a RFID is not active, it can be replaced by an External RFID chip. Naturally, we supply these customers the ECS RFID chip for free.
- ECS customers who bought pallets without the RFID chip, but who want to use the electronic track and trace systems.
- Egg graders and processors working with other kind of plastic pallets.

Where?

- The ECS RFID chip, made of durable materials and provided with super glue, stick on all parts of the pallet runner. In normal use, including washing, the RFID chip will remain to stay.
- To have it always at the same place, we created a circle in our pallet. This way the customer can identify where to stick the RFID chip.

Price?

- On demand and depending on numbers and freight tariffs.
